

CPSC 304 Project Cover Page

Milestone #: 4

Date: August 5

Group Number: 34

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Jack Yao	29843927	s9n0s	jackyao2004@gmail.com
Joshua Calalang	66829102	u6x4h	joshuacalalang@hotmail.com
Rahul Kamath	25650656	t9i7n	rahul.kamath2512@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above. (In the case of Project Milestone 0, the main purpose of this page is for you to let us know your e-mail address, and then let us assign you to a TA for your project supervisor.)

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

Project Description:

Our database application is designed for the food and online delivery industry, focusing on the seamless management of interactions between customers, delivery drivers, and restaurants. This application enables customers to create and log into their accounts, specify dietary preferences, order food from restaurants that match their preferences, and review their past orders.

For reasons in maintaining simplicity to account for the short summer course time, we have decided to keep our app local to Vancouver. Behold, Vancouver Eats!

Schema Changes:

In our final schema, we changed the data type of the OrderID attribute to an INT since this allows us to compare IDs easier. Similarly, we also changed CustomerPhoneNum to be VARCHAR rather than CHAR, as comparisons with CHAR enforces the length, which unnecessarily complicates the code in the server.

Project Schemas:

Ingredient(IngredientName, IngredientType)
IngredientName: varchar, PK
IngredientType: varchar

Customer(CustomerID, CustomerName, CustomerAddress, CustomerPhoneNum)
CustomerID: varchar, PK
CustomerName: varchar
CustomerAddress: varchar, not null
CustomerPhoneNum: varchar

HasDietaryPreference(**CustomerID**, IngredientName, PreferenceType)
CustomerID: varchar, PK FK
IngredientName: varchar, PK FK
PreferenceType: varchar

Orders(OrderID, OrderDate, **CustomerID**, **LicenseNum**, **RestaurantAddress**)
OrderID: int, PK
OrderDate: date
CustomerID: varchar, FK
LicenseNum: varchar, FK
RestaurantAddress: varchar, FK

DeliveryPerson(LicenseNum, DeliveryPersonName, DeliveryPersonRating, PhoneNum)
LicenseNum: char[8], PK
DeliveryPersonName: varchar
DeliveryPersonRating: float
PhoneNum: char[10], CK unique

Vehicle(LicensePlateNum, InsuranceExpiryDate, Brand, VehicleModel, VehicleColour)
LicensePlateNum: varchar, PK
InsuranceExpiryDate: date
Brand: varchar
VehicleModel: varchar
VehicleColour: varchar

OwnsVehicle(LicenseNum, LicensePlateNum)
LicenseNum: char[8], PK FK
LicensePlateNum: varchar, PK FK

Restaurant(RestaurantAddress, **RestaurantName**, RestaurantRating, RestaurantPhoneNum)
RestaurantAddress: varchar, PK
RestaurantName: varchar, FK
RestaurantRating: float
RestaurantPhoneNum: char[10], CK unique

RestaurantCuisine(RestaurantName, RestaurantCuisineType)
RestaurantName: varchar, PK
RestaurantCuisineType: varchar

Menu(MenuName, **RestaurantAddress**, MealType)
MenuName: varchar, PK
RestaurantAddress: varchar, PK FK
MealType: varchar

MenuItem(MenuItemName, Calories)
MenuItemName: varchar, PK
Calories: int

MenuFeaturesItem(MenuItemName, MenuName, ItemPrice)
MenuItemName: varchar, PK FK
MenuName: varchar, PK FK
ItemPrice: float, not null

ItemMadeWith(MenuItemName, IngredientName)
MenuItemName: varchar, PK FK
IngredientName: varchar, PK FK

OrderContains(OrderID, MenuItemName)
OrderID: int, PK FK
MenuItemName: varchar, PK FK

Drink(MenuItemName, Volume, AlcoholContent)
MenuItemName: varchar, PK FK
Volume: int
AlcoholContent: float

RotationItem(MenuItemName, StartDate, EndDate)
MenuItemName: varchar, PK FK
StartDate: date, not null
EndDate: date, not null

RotationalDrink(**MenuItemName**, Volume, AlcoholContent, StartDate, EndDate)
MenuItemName: varchar, PK FK
StartDate: date, not null
EndDate: date, not null
Volume: int
AlcoholContent: float

DELETE: Deleting one's account, which would subsequently delete the user's ingredients preferences by cascading

(deleting account from UI and receiving code 200)

A screenshot of a web browser displaying the 'Account' page. The page has a header with 'Hello 2!' and a list of links: 'Home', 'Edit dietary preferences', 'View order history', and 'Delete account'. A toast notification from 'localhost:50001' says 'Successfully deleted 2'. The Chrome DevTools Network tab is open, showing a list of network requests. The first request is 'account.html' (304, document, 265 B, 5 ms). The second is 'account.js' (304, script, 266 B, 14 ms). The third is 'styles.css' (304, stylesheet, 265 B, 13 ms). The fourth is '2' (200, fetch, 267 B, 13 ms). The fifth is '2/' (200, fetch, 227 B, Pending).

(database before and after account deletion, showing that user 2 had allergies to peanuts, and no longer existing in database afterwards)

```
[SQL>select * from hasdietarypreference where customerid = 2;]

CUSTOMERID INGREDIENTNAME
-----
PREFERENCETYPE
-----
2          Peanuts
Allergy

[SQL> select * from hasdietarypreference where customerid = 2;]

no rows selected

SQL> █
```

UPDATE: Updating ingredient preferences of the user.
